

White Ash and Cream Foils – Important Technical Information

Due to their lighter colour, White Ash and Cream products use a higher-performance foil designed to provide enhanced durability and improved long-term resistance to weathering and colour change.

The specialist properties of these foils mean that products manufactured in these colours cannot undergo our standard automated weld-cleaning process. Each weld must therefore be finished by hand. As a result, variations in the appearance and finish of individual welds are to be expected and are an inherent characteristic of the manufacturing process.

The images below show examples of the typical weld standard for White Ash windows.

As these products require additional labour to hand-finish, an extended lead time will apply. The applicable lead time will be confirmed at the point of order.
